

Fork Positioner for Forklift

Forklift Fork Positioners - The fork positioner is actually a hydraulic device that allows the the one driving to control the lift truck without leaving the seat. They are constructed out of top quality materials and are intended to be able to endure the most difficult procedures and work surroundings. Side shifting models have the extra ability to be able to laterally position the arms or the entire load so as to facilitate more accurate carrying and position in a faster and more efficient manner.

The unique fork pocket design could enable operators to securely swing the unit's blades without any worry of damaging the positioning cylinders. This can allow the operator the alternative to either perform independent or simultaneous fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into fork positioners on existing units.
