

Truss Jibs

Truss Jib - A truss jib is actually utilized in order to carry and position trusses. It is actually an extended jib attachment that is equipped along with a triangular or pyramid shaped frame. Usually, truss jibs are mounted on machines such as a compact telehandler, a skid steer loader or even a forklift utilizing a quick-coupler accessory.

Older style cranes which have deep triangular truss jibs are normally assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Each riveted or bolted joint is susceptible to rusting and therefore requires regular upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of another structural member. This design could cause narrow separation amid the smooth exteriors of the lacings. There is little room and limited access to preserve and clean them against rust. A lot of rivets loosen and corrode inside their bores and must be replaced.
